

Pelagic Data System/PDS

An Ultra-Light Vessel Tracking System (VTS) designed specifically for these small scale fisheries, providing key functionality such as fleet tracking, activity monitoring, and data analysis, without the complex infrastructure of a satellite-based system

How it Works

PDS is working by application-specific wireless sensors which is automatic data collection while there is the movements. Data from PDS will uploaded via cellular network then sending the data into cloud-based data analytics. User will enable to see the data visualization on a customizable dashboard
